Emergency Services, L.L.C.

emTracker™ is a breakthrough technology that can employ the Internet or an intranet to gather, track, and coordinate the data, operations, resources, personnel, and guidance that are necessary in the management of any major emergency. With **emTracker™** an Emergency Operations Center (EOC) can afford an integrated information management system that can draw data directly from servicing 9-1-1 centers without requiring an individual to reenter or reconfigure reports. **emTracker™** employs a unique database to track and report in real-time costs associated with an emergency response. These reports detail who, what, when and how the expense was accrued and can be submitted to state and federal authorities as often as desired to obtain swift reimbursement."

emTracker™ is your premier emergency management tool!

- Real-time event summaries capable of following multiple emergencies
- Planning documents, checklists, and position guidance keyed to the emergency at hand, displayed in an easy-to-use drill-down format
- A real-time resource management system that tracks depletion and associated costs and *enables the submission of immediate claims to FEMA and state agencies*
- A decision tracking and suspense system
- A sophisticated multi-track messaging system permitting general dissemination, private communication, and everything in between
- Can simulate events for training and evaluation
- Public and media-access screens
- Multiple layers of security
- Standard and locally developed reports
- Easy, effective links to neighboring, state, or federal agencies
- All displays can be localized!
- A complete record of all actions and messages

User friendly. *Anyone can learn to use **emTracker™** in less than one day!*

The system can be employed using an EOC projection system or with networked computers. The web-based version allows personnel at the scene or in another country to participate in incident. A small investment will allow the smallest agency to obtain secure, real-time access to state and national weather trends, satellite images, mapping information, details of operations in other jurisdictions and other data vital to the mitigation of any contingency. The resource management system will greatly enhance the EOC's ability to recoup costs from FEMA or state agencies. Reimbursements that otherwise might be lost, should pay for **emTracker™** very quickly.

Most EOCs operate on general funds with limited budgets that force them to "make do" with a minimum inventory of radios, phones, fax machines, and manually maintained status boards. Reporting, tracking, and data dissemination significantly lag "real-time" and many vital tasks, such as accounting for costs, must be accomplished in the days following the event's conclusion. Few, if any, affordable, real-time systems meet the total needs of the average EOC. Some require a trained full-time staff to keep them current. Others track events but fail to provide guidance. Few provide an intuitive messaging system. **emTracker™** provides the whole package within your budget. Now even 'Smallville' can have a command center equal to those operated by our largest cities.
